StricklySoft Completes Full Web Deployment with Developer Toolchain, Database Infrastructure, and Mobile-Responsive SaaS Platform

On **Saturday, May 24, 2025**, StricklySoft completed the live deployment of its production website — built using **Next.js**, **React**, and best practices in responsive design. The site is fully optimized for desktop, tablet, and mobile viewing.

Earlier that morning, the company finalized the setup of its complete development toolchain:

-  **Visual Studio Code** for full-stack engineering
-  **SQL Server & PostgreSQL** for robust data services
-  **ASP.NET Core API integration** with deployment-ready endpoints

By the end of the day, the entire site had been designed, written, and published — including product overviews, legal documents, company info, and accessibility statements.

“We engineered the frontend with the same mindset we apply to our backend: clarity, structure, and reliability,” said **Mark Strickland**. “Every detail matters when you want to build something that lasts.”

The completed site reflects Fortune 500 design sensibilities while staying nimble, developer-driven, and user-first.
